

Editorial

Dear Colleagues,

Like every year-end at such a time, I am pleased to accompany the publication of the Irig scientific letter with a few words. The main purpose is to share with you the elements that seem to me to have marked the year that is ending. Unfortunately, it is difficult not to start by mentioning the health crisis we are going through, with a new wave of infections whose magnitude is still difficult to grasp. We are facing an event that disrupts our daily life and weakens many mechanisms and balances on a global scale. Each of us is facing this situation individually while the communities are constantly trying to adapt in order to find the best compromise between maintaining our activities, whether professional, cultural or sports, and the necessary caution in the face of the pandemic. In such a context, it seems to me that we can, because of our scientific culture, play a particular role by trying to speak as objectively and rationally as possible, a speech that is both humble and full of hope inspired by the confidence we have in the advances that will be made to strengthen our preventive and therapeutic arsenal against SARS-CoV2. As you may know, several IRIG teams are brilliantly involved in these advances.

The past year has been marked by numerous outstanding scientific results, such as those you will discover in this letter. These results make the IRIG laboratories actors in major issues for the planet and its inhabitants; in this way, they give sense to our activity, whether it is in the field of research or support to research. This activity must be carried out in a favorable environment, in which each and every one of you is offered the capacity to fully develop in your work. As I write this, I am fully aware of the work that remains to be done. The year 2022 will be resolutely turned towards this objective, with in particular the pursuit of the action that has been undertaken on the analysis of psycho-social risks and the resumption of reflections and initiatives with a view to ensuring that the IRIG becomes an increasingly shared project.

Many of you would like the institute's laboratories to be grouped together in a limited number of buildings in order to enhance user-friendliness, equipment sharing and interaction between disciplines. Responding to this expectation is one of the priority objectives of the IRIG board. A dynamic has been launched thanks to the support of the CEA's general management, of the CEA/DRF division and of the CEA/Grenoble center. Renovation work on buildings 10.05 and C3 has already made it possible to bring together a large part of the Nano-Physics Department and the Institute's support teams, respectively. The general assembly of IRIG staff to be held on January 31 will be an opportunity to present an assessment of these actions, as well as the prospects that should open up to us thanks to the project that IRIG has submitted under the new State-Region Plan Contract (CPER).

The year 2022 is fast approaching. I hope that this new year will allow our community to continue to grow; each of us can work at his level to move in this direction. This year will be special for me as I have decided to stop my professional activity during the second semester. A new management team of the IRIG will therefore be put in place. I have no doubt that this change will bring a new impetus to the construction of this very beautiful object that is IRIG. I will obviously put all my energy in the coming months to prepare this transition while continuing my current missions, listening to you.

I wish you a merry Christmas and a very nice holiday season!

Jérôme Garin, Head of the Interdisciplinary
Research Institute of Grenoble

At the front page of IRIG

Towards tailored, biosourced biocides

Design of tailored biocides, *i.e.* depending on their use, capable of releasing the necessary dose of metal ions while avoiding the untimely release of toxic ions into the environment.

The spectrum of holes haunts qubits

Usually, quantum engineering designs quantum bits with semiconductor components, exploiting the properties of superconducting elements or electrons. Here a very promising alternative is presented which uses holes instead of electrons.
